

FELINE SILICA

Available clinical data indicates a strong link between silica uroliths and consumption of specific dietary ingredients. Diets that contain substantial quantities of corn gluten feed, grain hulls, and whole grains are especially suspect. Water in volcanic areas has also been implicated in the formation of silica uroliths because of its high silica content.

MINIMIZING RECURRENCE

** Review manufacturer's therapeutic food literature to determine indications/contraindications. For pets with multiple health concerns, consult a veterinary nutritionist to select an optimal food.
